# Wall Mounted on Sheetrock Acoustical Panels
Using 3M Command™ Strip

Installation Steps

Packaged Components

Xorel Artform
Panels with
Command Strips

Additional Tools Needed

Measuring Tape
Pencil
Wide Field Laser
Level

Tips for Installation
Lay out the panels and mounting materials before installing.

We recommend having a rendering/layout of the final design on site for reference during installation.
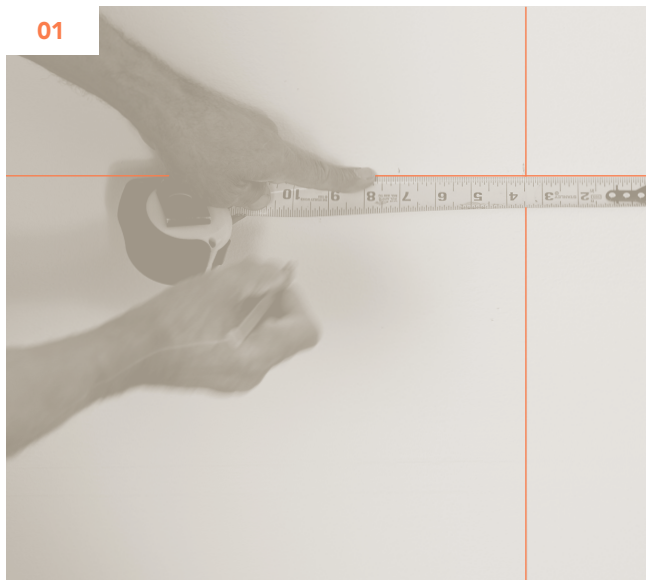

Make sure wall is free of dust/dirt or the Command Strip will not adhere properly.

There should be no openings/gaps between adjacent panels. If there are fit issues with panels, please contact us.

If there are open spaces in a design, an extra panel can be put (not installed) in that space as a placeholder. Once all the panels around the open space are installed the extra panel can be removed.

Removal Process
To remove Command strips from the wall after panels are taken down, pull the adhesive tab parallel to the wall until the strip releases. Once the strips are removed they cannot be reused. For reapplication Command strips can be purchased at any hardware store.

01

Using a level or laser, mark the wall where the first row of panels will go and determine a center point of that row.

02

Locate the arrow on the back of each panel to determine the grain line of the fabric. Each panel's grain line should be in the same direction.

03

Remove the backing from each Command strip.

04

Match the center point of the panel with the center point of the wall, and apply the panel to the wall.

05

Apply pressure to the sides of the panel to make sure the panel is secure. As you install additional panels, interlock each panel to minimize gaps.

06

Once multiple panels are installed, make sure they are level and square using a level or laser.
